

# INTRODUCING

# SuperDrainasphalt™

SuperDrainasphalt™ is a permeable asphalt which allows water to pass freely through to the underlying structure and can be used as a surface course for sustainable drainage systems (SuDS). Designed to reduce the potential impact of surface water drainage in new and existing developments.

## WHY SUPERDRAINASPHALT™?

### SUSTAINABLE

Can be used as part of a SuDS system for stormwater management - high permeability and drainage capacity, reducing the risk of downstream flooding.

### VERSATILE

SuperDrainasphalt™ can be supplied as a surface, binder or base course and comes in various sizes to suit a range of applications. Can be used as part of composite road pavements with block paving. Ideal for projects with a high proportion of hard standing such as park and ride schemes and retail parks.

### ENHANCED SAFETY

SuperDrainasphalt™ drains freely, creating an absence of standing water and subsequent ice hazard in cold weather. Reduces glare from wet pavements and no standing water lessens risk of hydroplaning.

### REDUCED NOISE

Inverted texture allows for high-capacity acoustic absorption.

### LOW MAINTENANCE

Reduced effects of pollution in runoff on the environment through water cleansing. Mitigates surface pollutants and minimises urban impact on natural water cycle.

### LONG-LASTING

Durability maximised by careful mix design and use of a carefully selected polymer-modified binder for pedestrian and light traffic use applications.

### ECO-FRIENDLY

Create sustainable projects – all mixes can be supplied as SuperLow warm mix asphalt.
